

## Exercise 6.1

### Reactions of Metals with Nonmetals

1. Identify the ion most commonly formed from each of these metals.

- (a) Ba                      (b) Ca                      (c) Cs                      (d) K
- (e) Li                      (f) Mg                      (g) Na                      (h) Sr

2. Identify the monoatomic ion most commonly formed from each of these nonmetals.

- (a) Br<sub>2</sub>                      (b) Cl<sub>2</sub>                      (c) F<sub>2</sub>                      (d) I<sub>2</sub>
- (e) N<sub>2</sub>                      (f) O<sub>2</sub>                      (g) S<sub>8</sub>                      (h) Se

3. Identify the ionic compound formed in each of the following reactions.

- (a) Li reacts with O<sub>2</sub>                      (b) Mg reacts with O<sub>2</sub>
- (c) Li reacts with N<sub>2</sub>                      (d) Ca reacts with N<sub>2</sub>
- (e) K reacts with I<sub>2</sub>                      (f) Ba reacts with Cl<sub>2</sub>
- (g) Sr reacts with Br<sub>2</sub>                      (h) Na reacts with S<sub>8</sub>

4. Write a balanced chemical equation for each of the following reactions.

*Include states of matter. Unless indicated otherwise, the nonmetals are gases.*

- (a) Li reacts with O<sub>2</sub>                      (b) Mg reacts with O<sub>2</sub>
- (c) Li reacts with N<sub>2</sub>                      (d) Ca reacts with N<sub>2</sub>
- (e) K reacts with I<sub>2</sub>(s)                      (f) Ba reacts with Cl<sub>2</sub>
- (g) Sr reacts with Br<sub>2</sub>(l)                      (h) Na reacts with S<sub>8</sub>(s)
