

Answers to Exercise 7.5 More Stoichiometry Practice

1.	$\text{CaCO}_3(\text{s})$	+	$2 \text{H}^+(\text{aq})$	→	$\text{Ca}^{2+}(\text{aq})$	+	$\text{H}_2\text{O}(\text{l})$	+	$\text{CO}_2(\text{g})$
M	100.087 g/mol		1.0079 g/mol		40.078 g/mol		18.0152 g/mol		44.0098 g/mol
C_{initial}			1.65 mol/L						
V_{initial}			225 mL						
m_{initial}	25.5 g								
P									92.7 kPa
T									293.65 K

n_{initial}	0.255 mol	0.371 mol		0 mol
n_{change}	-0.186 mol	-0.371 mol		+0.186 mol
n_{final}	0.069 mol	0 mol		0.186 mol

$V_{\text{final}} \qquad \qquad \qquad 0.00489 \text{ m}^3 = 4.89 \text{ L}$

Step 1: Write a balanced chemical equation for the reaction

see above

Step 2: Organize all known information

see above; values in grey are not necessary for this calculation

Step 3: Calculate moles of CaCO_3 and H^+ (n_{initial})

$$n_{\text{CaCO}_3\text{-initial}} = 25.5\text{g} \times \frac{1\text{mol}}{100.087\text{g}} = 0.255\text{mol}$$

$$n_{\text{H}^+\text{-initial}} = 225\text{mL} \times \frac{1\text{L}}{1000\text{mL}} \times \frac{1.65\text{mol}}{1\text{L}} = 0.371\text{mol}$$

Step 4: Identify the limiting reagent

$2(0.255 \text{ mol}) = 0.510 \text{ mol H}^+$ are required to react with 0.255 mol CaCO_3 . Since there is less H^+ than this, the H^+ will run out before the CaCO_3 . H^+ is therefore the limiting reagent.

Step 5: Use mole ratio to calculate moles of CO_2 produced (n_{final})

$$n_{\text{CO}_2} = 0.371 \text{ mol H}^+ \times \frac{1 \text{ mol CO}_2}{2 \text{ mol H}^+} = 0.186 \text{ mol CO}_2$$

Step 6: Calculate volume of CO_2 produced in m^3 (V_{final})

$$PV = nRT$$

$$V_{\text{CO}_2\text{-final}} = \frac{nRT}{P} = \frac{(0.186\text{mol})\left(8.3145\frac{\text{Pa}\cdot\text{m}^3}{\text{mol}\cdot\text{K}}\right)(293.65\text{K})}{(92.7\text{kPa})} \times \frac{1\text{kPa}}{1000\text{Pa}} = 0.00489\text{m}^3$$

Step 7: Calculate volume of CO_2 produced in L (V_{final})

$$V_{\text{CO}_2\text{-final}} = 0.00489\text{m}^3 \times \frac{1000\text{L}}{1\text{m}^3} = 4.89\text{L}$$

Step 8: Check your work

Does your answer seem reasonable? Are sig. fig. correct?

2.

V_{final} 1.6 L
P 88100 Pa
T 295.65 K

$n_{initial}$	0.057 mol	0 mol	0 mol
n_{change}	-0.057 mol	+0.057 mol	+0.057 mol
n_{final}	0 mol	0.057 mol	0.057 mol
$m_{initial}$	26 g		

Step 1: Write a balanced chemical equation for the reaction

see above

Step 2: Organize all known information

see above; values in grey are not necessary for this calculation

Step 3: Calculate moles of O₂ produced (n_{final})

$$PV = nRT$$

$$n_{O_2-final} = \frac{PV}{RT} = \frac{(88100Pa)(1.6L)}{\left(8.3145 \frac{Pa \cdot m^3}{mol \cdot K}\right)(295.65K)} \times \frac{1m^3}{1000L} = 0.057mol$$

Step 4: Use mole ratio to calculate moles of Tl₂O₃ required for reaction ($n_{initial}$)

$$n_{Tl_2O_3-initial} = 0.057 mol O_2 \times \frac{1 mol Tl_2O_3}{1 mol O_2} = 0.057 mol Tl_2O_3$$

Step 5: Calculate mass of Tl₂O₃ required for reaction ($m_{initial}$)

$$m_{Tl_2O_3-initial} = 0.057 mol Tl_2O_3 \times \frac{456.764g}{1 mol} = 26 g Tl_2O_3$$

Step 6: Check your work

Does your answer seem reasonable? Are sig. fig. correct?

The answer is less than 65 g (the maximum amount possible of Tl₂O₃ in the sample).
