$\qquad$
$\qquad$

INSTRUCTIONS: 1) Please read over the test carefully before beginning. You should have 8 pages of questions, a blank "overflow" page and two pages of data sheets with periodic table.
2) If your work is not legible, it will be given a mark of zero.
3) Marks will be deducted for incorrect information added to an otherwise correct answer.
4) Marks will be deducted for improper use of significant figures and for missing or incorrect units.
5) Show your work for all calculations. Numerical answers without supporting calculations will not be given full credit.
6) You may use a calculator but only for the purposes of calculation. No textcapable calculators are allowed.
7) You have 90 minutes to complete this test.

## Confidentiality Agreement:

I agree not to discuss (or in any other way divulge) the contents of this exam until after 8:30 pm Mountain Time on Tuesday, March $17^{\text {th }}, 2020$. I understand that breaking this agreement would constitute academic misconduct, a serious offense with serious consequences. The minimum punishment would be a mark of $0 / 65$ on this exam and removal of the "overwrite midterm mark with final exam mark" option for my grade in this course; the maximum punishment would include expulsion from this university.

## Question Breakdown

| Q1 | 17 |
| :--- | ---: |
| Q2 | 16 |
| Q3 | 113 |
| Q4 | 110 |
| Q5 | 13 |
| Q6 | 18 |
| Q7 | 118 |

| Total | $/ 65$ |
| :--- | :--- |

$\qquad$
$\qquad$
$\qquad$
1.
(a) Complete each statement with one of the following symbols: $>,<$ or $=$ For an allowed process at constant temperature and pressure,
i. $\Delta S_{\text {universe }}>0$
ii. $\Delta G<0$
iii. $E>0$
iv. $K>Q$
(b) One of the statements in part (a) is true under any conditions (not just at constant temperature and pressure). Which one?
[1 mark]

$$
\Delta S_{\text {universe }}>0
$$

(c) In statement (a) i., why do we have to write $\Delta S_{\text {universe }}$ ? Why can't we just write $\Delta S$ ? $\Delta S$ refers to the entropy change for the system only. $\Delta S_{\text {universe }}$ also includes the entropy change for the surroundings, and the second law of thermodynamics states that the entropy of the universe must increase in any thermodynamically allowed process.
(d) In statement ii. in part (a), can $\Delta G$ be replaced by $\Delta G^{\circ}$ ? Why or why not? No.
$\Delta G^{\circ}$ refers specifically to the free energy change of a reaction under standard conditions. $\Delta G$ refers to the free energy change of a reaction under whatever conditions it is actually being run.
2. Consider the following reaction that takes place in aqueous acid.
[6 marks]

$$
\mathrm{Cr}_{2} \mathrm{O}_{7(a q)}^{2-}+\mathrm{Zn}_{(s)} \rightarrow \mathrm{Zn}_{(a q)}^{2+}+\mathrm{Cr}_{(a q)}^{3+}
$$

(a) Balance this equation under acidic conditions.

For full marks, your answer must include balanced half reactions.

$$
\begin{aligned}
\left(\mathrm{Zn}_{(s)}\right. & \left.\rightarrow \mathrm{Zn}_{(a q)}^{2+}+2 e^{-}\right) \times 3 \\
\mathrm{Cr}_{2} \mathrm{O}_{7(a q)}^{2-}+14 \mathrm{H}_{(a q)}^{+}+6 e^{-} & \rightarrow 2 \mathrm{Cr}_{(a q)}^{3+}+7 \mathrm{H}_{2} \mathrm{O}_{(l)} \\
\hline \mathrm{Cr}_{2} \mathrm{O}_{7(a q)}^{2-}+3 \mathrm{Zn}_{(s)}+14 \mathrm{H}_{(a q)}^{+} & \rightarrow 2 \mathrm{Cr}_{(a q)}^{3+}+3 \mathrm{Zn}_{(a q)}^{2+}+7 \mathrm{H}_{2} \mathrm{O}_{(l)}
\end{aligned}
$$

(b) Identify the oxidizing agent.
$\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}$
(c) Identify the reducing agent.

Zn
(d) What is $v_{e}$ for this reaction?
$\qquad$
$\qquad$
$\qquad$
3. Ethene, essential in making plastics, can be produced electrolytically from carbon dioxide and water using surplus electricity. The two half-reactions involved are shown below. [13 marks] Water is written in the gas phase for consistency with later parts of the question which will deal with this process at high temperature.

$$
\begin{array}{lr}
\text { cathode } 2 \mathrm{CO}_{2(g)}+8 \mathrm{H}_{2} \mathrm{O}_{(g)}+12 e^{-} \rightarrow \mathrm{C}_{2} \mathrm{H}_{4(g)}+12 \mathrm{OH}_{(a q)}^{-} \\
\text {anode } & 4 \mathrm{OH}_{(a q)}^{-} \rightarrow O_{2(g)}+2 \mathrm{H}_{2} \mathrm{O}_{(g)}+4 e^{-}
\end{array}
$$

(a) Clearly label which half-reaction occurs at the anode and which occurs at the cathode. [1 mark] see above
(b) Write the overall balanced reaction for this process.
[1 mark]

$$
2 \mathrm{CO}_{2(g)}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})} \rightarrow \mathrm{C}_{2} \mathrm{H}_{4(\mathrm{~g})}+3 \mathrm{O}_{2(\mathrm{~g})}
$$

(c) What is $v_{e}$ for this process?
(d) Calculate the standard Gibbs free energy change for this process.

For consistency with later parts of the question, please use data for water in the gas phase.
$\Delta_{r} G^{\circ}=\Delta_{f} G^{\circ}\left(C_{2} H_{4(g)}\right)+3 \Delta_{f} G^{\circ}\left(O_{2(g)}\right)-\left[2 \Delta_{f} G^{\circ}\left(\mathrm{CO}_{2(g)}\right)+2 \Delta_{f} G^{\circ}\left(H_{2} O_{(g)}\right)\right]$
$\Delta_{r} G^{\circ}=\left(68.36 \frac{\mathrm{~kJ}}{\mathrm{~mol}}\right)+3\left(0 \frac{\mathrm{~kJ}}{\mathrm{~mol}}\right)-\left[2\left(-394.37 \frac{\mathrm{~kJ}}{\mathrm{~mol}}\right)+2\left(-228.6 \frac{\mathrm{~kJ}}{\mathrm{~mol}}\right)\right]$
$\Delta_{r} G^{\circ}=1314.3 \frac{\mathrm{~kJ}}{\mathrm{~mol}}$
(e) Calculate the standard cell potential (or standard emf) for this process.
$\Delta_{r} G^{\circ}=-v_{e} F E^{\circ}$
$E^{\circ}=-\frac{\Delta_{r} G^{\circ}}{v_{e} F}$
$E^{\circ}=-\frac{\left(1314.3 \frac{\mathrm{~kJ}}{\mathrm{~mol}}\right)\left(\frac{1000 \mathrm{~J}}{1 \mathrm{~kJ}}\right)}{(12)\left(96485 \frac{\mathrm{C}}{\mathrm{mol}}\right)}$
$E^{\circ}=-1.1352 \frac{J}{C}=-1.1352 \mathrm{~V}$
$\qquad$
3. ...continued
(f) Calculate Q for this process when it is performed at $800^{\circ} \mathrm{C}$ and the partial pressures of carbon dioxide and water vapour are both 1.00 kbar while the partial pressures of ethene and oxygen are both 1.00 mbar .
[3 marks]
$a_{\mathrm{CO}_{2}}=\frac{1.00 \mathrm{kbar}}{1 \mathrm{bar}} \times \frac{1000 \mathrm{bar}}{1 \mathrm{kbar}}=1.00 \times 10^{3} \quad a_{C_{2} \mathrm{H}_{4}}=\frac{1.00 \mathrm{mbar}}{1 \mathrm{bar}} \times \frac{1 \mathrm{bar}}{1000 \mathrm{mbar}}=1.00 \times 10^{-3}$
$a_{H_{2} \mathrm{O}}=\frac{1.00 \mathrm{kbar}}{1 \mathrm{bar}} \times \frac{1000 \mathrm{bar}}{1 \mathrm{kbar}}=1.00 \times 10^{3} \quad a_{\mathrm{O}_{2}}=\frac{1.00 \mathrm{mbar}}{1 \mathrm{bar}} \times \frac{1 \mathrm{bar}}{1000 \mathrm{mbar}}=1.00 \times 10^{-3}$
$Q=\frac{\left(a_{C_{2} H_{4}}\right)\left(a_{O_{2}}\right)^{3}}{\left(a_{C_{2}}\right)^{2}\left(a_{H_{2}}\right)^{2}}$
$Q=\frac{\left(1.00 \times 10^{-3}\right)\left(1.00 \times 10^{-3}\right)^{3}}{\left(1.00 \times 10^{3}\right)^{2}\left(1.00 \times 10^{3}\right)^{2}}$
$Q=1.00 \times 10^{-24}$
(g) Calculate the cell potential (or emf) for this process under the conditions described in part (f). The standard cell potential for this process at $800^{\circ} \mathrm{C}$ is -1.120 V .
[3 marks]
$E=E^{\circ}-\frac{R T}{v_{e} F} \ln Q$
$E=(-1.120 \mathrm{~V})-\frac{\left(8.314462 \frac{\mathrm{~J}}{\mathrm{~mol} \cdot \mathrm{~K}}\right)(1073.15 \mathrm{~K})}{(12)\left(96485 \frac{\mathrm{C}}{\mathrm{mol}}\right)} \ln \left(1.00 \times 10^{-24}\right)\left(\frac{1 \mathrm{~V}}{1 \frac{J}{\mathrm{C}}}\right)$
$E=(-1.120 \mathrm{~V})-(-0.42587 \mathrm{~V})$
$E=-0.694 \mathrm{~V}$
$\qquad$
$\qquad$
$\qquad$
4.
(a) Draw a phase diagram for water. Your diagram must include:

- Labeled axes
- Labeled phases
- Labeled triple point
- Labeled critical point

You do not need to include numerical values on your diagram.

(b) On your phase diagram, draw a line of constant pressure where only sublimation occurs. Label your line "sublimation".
[1 mark]
(c) On your phase diagram, draw a line of constant temp. where condensation is followed by melting. Label your line "condensation/melting".
[1 mark]
5. The dissociation of water into $H_{(a q)}^{+}$and $\mathrm{OH}_{(a q)}^{-}$is an endothermic process. Would you expect the pH of water to increase or decrease as the temperature of water increases at constant pressure? Justify your answer.
[3 marks]
Hint: remember that $\mathrm{pH}=-\log \left(a_{H_{(a q)}^{+}}\right)$
$\mathrm{H}_{2} \mathrm{O}_{(l)} \rightleftharpoons \mathrm{H}_{(a q)}^{+}+\mathrm{OH}_{(a q)}^{-}$
This process is endothermic, so heating the system will push the equilibrium more toward the products side (Le Châtelier's principle). Therefore, as temperature increases, concentration of $\mathrm{H}^{+}$ increases and the pH decreases.
$\qquad$
$\qquad$
6. In CHEM 1000, you would have learned that the following reaction does NOT occur (unlike the analogous reaction of water with any of the other Group 2 metals):
[8 marks]

$$
\mathrm{Be}_{(s)}+2 \mathrm{H}_{2} \mathrm{O}_{(l)} \rightarrow \mathrm{Be}(\mathrm{OH})_{2(s)}+\mathrm{H}_{2(\mathrm{~g})}
$$

(a) Is this reaction thermodynamically allowed at $25^{\circ} \mathrm{C}$ if the pressure of $\mathrm{H}_{2(\mathrm{~g})}$ is 0.05 bar ?
[6 marks]
$\Delta_{r} G^{\circ}=\left[\Delta_{f} G^{\circ}\left(B e(O H)_{2(s)}\right)+\Delta_{f} G^{\circ}\left(H_{2(g)}\right)\right]-\left[\Delta_{f} G^{\circ}\left(B e_{(s)}\right)+2 \Delta_{f} G^{\circ}\left(H_{2} O_{(l)}\right)\right]$
$\Delta_{r} G^{\circ}=\left[\left(-818 \frac{\mathrm{~kJ}}{\mathrm{~mol}}\right)+\left(0 \frac{\mathrm{~kJ}}{\mathrm{~mol}}\right)\right]-\left[\left(0 \frac{\mathrm{~kJ}}{\mathrm{~mol}}\right)+2\left(-237.140 \frac{\mathrm{~kJ}}{\mathrm{~mol}}\right)\right]$
$\Delta_{r} G^{\circ}=-344 \frac{\mathrm{~kJ}}{\mathrm{~mol}}$
$Q=\frac{\left(a_{B e(O H)_{2}}\right)\left(a_{H_{2}}\right)}{\left(a_{B e}\right)\left(a_{H_{2}} \mathrm{O}\right)^{2}}$
$Q=\frac{(1)(0.05)}{(1)(1)^{2}}$
$Q=0.05$
$T=298.15 K$
$\Delta_{r} G=\Delta_{r} G^{\circ}+R T \ln Q$
$\Delta_{r} G=\left(-344 \frac{\mathrm{~kJ}}{\mathrm{~mol}}\right)+\left(8.314462 \frac{\mathrm{~J}}{\mathrm{~mol} \cdot \mathrm{~K}}\right)(298.15 \mathrm{~K}) \ln (0.05)$
$\Delta_{r} G=-351 \frac{\mathrm{~kJ}}{\mathrm{~mol}}$
$\Delta_{r} G$ is negative, so the reaction is thermodynamically allowed.
(b) Discuss briefly the agreement or disagreement between the result of your calculation and the observation that beryllium does not react with water.
[2 marks]

The fact that the reaction is thermodynamically allowed means that it *may* happen not that it must happen. In order for a reaction to occur, it must be both thermodynamically and kinetically favourable, so it's possible that the activation energy for this reaction may be too high. It's also possible that a passivation layer of BeO means that the beryllium wouldn't actually be in contact with water if a sample of beryllium were placed in water.
$\qquad$
$\qquad$
7. The Boudouard reaction is the following:
[18 marks]

$$
2 \mathrm{CO}_{(g)} \rightleftharpoons \mathrm{CO}_{2(g)}+C_{(s)}
$$

This reaction is a serious nuisance in industrial processes involving carbon monoxide since it results in the deposition of graphite, which leads to fouling of the lines transporting this gas.
(a) Is this a redox reaction? Justify your answer.
[1 mark]

Yes. The oxidation state of carbon is different in the products than in the reactant.
In CO , it is +2 . In $\mathrm{CO}_{2}$, it is +4 . In $C$, it is 0 .
(b) Calculate the equilibrium constant for this reaction at $25^{\circ} \mathrm{C}$. Is the reaction reactant-favoured or product-favoured under standard conditions?

$$
\begin{aligned}
& \Delta_{r} G^{\circ}=\left[\Delta_{f} G^{\circ}\left(C O_{2(g)}\right)+\Delta_{f} G^{\circ}\left(C_{(s)}\right)\right]-2 \Delta_{f} G^{\circ}\left(C O_{(g)}\right) \\
& \Delta_{r} G^{\circ}=\left[\left(-394.37 \frac{k J}{m o l}\right)+\left(0 \frac{\mathrm{~kJ}}{\mathrm{~mol}}\right)\right]-2\left(-137.17 \frac{\mathrm{~kJ}}{\mathrm{~mol}}\right) \\
& \Delta_{r} G^{\circ}=-120.03 \frac{\mathrm{~kJ}}{\mathrm{~mol}} \\
& \Delta_{r} G^{\circ}=-1.2003 \times 10^{5} \frac{\mathrm{~J}}{\mathrm{~mol}} \\
& T=298.15 \mathrm{~K} \\
& \Delta_{r} G^{\circ}=-R T \ln K \\
& K=e^{\frac{-\Delta_{r} G^{\circ}}{R T}} \\
& K=e^{\frac{-\left(-1.2003 \times 10^{5} \frac{J}{m o l}\right)}{\left(8.31446 \frac{J}{m o l \cdot K}\right)(298.15 \mathrm{~K})}} \\
& K=e^{48.420} \\
& K=1.07 \times 10^{21}
\end{aligned}
$$

K is very large, so this is a strongly product-favoured reaction under standard conditions.
$\qquad$
$\qquad$
7. ...continued
(c) Estimate the equilibrium constant for this reaction at $250^{\circ} \mathrm{C}$.

$$
\begin{array}{ll}
T_{1}=25^{\circ} \mathrm{C}=298.15 \mathrm{~K} & T_{2}=250^{\circ} \mathrm{C}=523.15 \mathrm{~K} \\
K_{1}=1.07 \times 10^{21} & K_{2}=? ? ?
\end{array}
$$

$$
\begin{aligned}
& \Delta_{r} H^{\circ}=\left[\Delta_{f} H^{\circ}\left(C O_{2(g)}\right)+\Delta_{f} H^{\circ}\left(C_{(s)}\right)\right]-2 \Delta_{f} H^{\circ}\left(C O_{(g)}\right) \\
& \Delta_{r} H^{\circ}=\left[\left(-393.51 \frac{\mathrm{~kJ}}{\mathrm{~mol}}\right)+\left(0 \frac{\mathrm{~kJ}}{\mathrm{~mol}}\right)\right]-2\left(-110.53 \frac{\mathrm{~kJ}}{\mathrm{~mol}}\right) \\
& \Delta_{r} H^{\circ}=-172.45 \frac{\mathrm{~kJ}}{\mathrm{~mol}} \\
& \Delta_{r} H^{\circ}=-1.7245 \times 10^{5} \frac{\mathrm{~J}}{\mathrm{~mol}}
\end{aligned}
$$

$$
\ln \left(\frac{K_{2}}{K_{1}}\right)=\frac{\Delta_{r} H^{\circ}}{R}\left(\frac{1}{T_{1}}-\frac{1}{T_{2}}\right)
$$

$$
\ln \left(\frac{K_{2}}{1.07 \times 10^{21}}\right)=\left(\frac{-1.7245 \times 10^{5} \frac{\mathrm{~J}}{\text { mol }}}{8.314462 \frac{J}{\text { mol } \cdot \mathrm{K}}}\right)\left(\frac{1}{298.15 \mathrm{~K}}-\frac{1}{523.15 \mathrm{~K}}\right)
$$

$$
\ln \left(\frac{K_{2}}{1.07 \times 10^{21}}\right)=-29.919
$$

$$
\frac{K_{2}}{1.07 \times 10^{21}}=e^{-29.919}
$$

$$
\frac{K_{2}}{1.07 \times 10^{21}}=1.01 \times 10^{-13}
$$

$$
K_{2}=\left(1.07 \times 10^{21}\right)\left(1.01 \times 10^{-13}\right)
$$

$$
K_{2}=1.08 \times 10^{8}
$$

$\qquad$
$\qquad$ Student Number:
7. ...continued
(d) At 975 K , the equilibrium constant for the Boudouard reaction is 1 . Suppose that a container holds 58 bar of CO at 975 K . What will the partial pressures of CO and $\mathrm{CO}_{2}$ be when the system reaches equilibrium in this container?
[6 marks]

|  | $2 \mathrm{CO}_{(g)}$ | $\rightleftharpoons$ | $\mathrm{CO}_{2(g)}$ | + |
| :--- | :---: | :---: | :---: | :---: |
| I bar) | 58 | 0 | $C_{(s)}$ |  |
| C (bar) | $-2 x$ |  | $x$ |  |
| E (bar) | $58-2 x$ | $x$ | $+x$ |  |
|  |  |  |  | $x$ |

$K=\frac{\left(a_{C O_{2(g)}}\right)\left(a_{C_{(S)}}\right)}{\left(a_{C o_{(g)}}\right)^{2}}$
$a_{C O_{(g)}}=\frac{(58-2 x) \text { bar }}{1 \text { bar }}=58-2 x$

$$
\begin{aligned}
& a_{C O_{2(g)}}=\frac{x b a r}{1 b a r}=x \\
& a_{C_{(s)}}=1
\end{aligned}
$$

$K=\frac{(x)(1)}{(58-2 x)^{2}}$
$1=\frac{x}{(58-2 x)^{2}}$
$(58-2 x)^{2}=x$
$3364-232 x+4 x^{2}=x$
$4 x^{2}-233 x+3364=0$
$x=\frac{-(-233) \pm \sqrt{(-233)^{2}-4(4)(3364)}}{2(4)}$
$x=\frac{233 \pm \sqrt{465}}{8}$
$x=31.8$ or 26.4

But $x$ cannot be 31.8 because that would give a negative value for the pressure of CO.
Therefore, $x=26.4$.

$$
\begin{aligned}
& p_{C O_{2(g)}}=(x)(1 \text { bar })=(26.4)(1 \text { bar })=26.4 \text { bar } \\
& p_{C O_{(g)}}=(58-2 x)(1 \text { bar })=(58-2(26.4))(1 \text { bar })=(58-52.8) \text { bar }=5 \text { bar }
\end{aligned}
$$
